

I am seeking a position as a Web and Application Developer where I can apply my technical skills and contribute to developing innovative and secure digital solutions within a professional environment. I bring a strong foundation combining software development expertise, business understanding, and the ability to deliver high-quality solutions that meet both user needs and business objectives.

I hold a BTS in Web and Application Development, in addition to a Licence in Marketing. My educational background provides me with a unique blend of strategic thinking and market awareness, alongside advanced technical skills in front-end and back-end development, system design, and effective problem-solving.

My practical experience includes **five months of intensive training at Not Easy**, where I worked on production-level applications and undertook real responsibilities. Following this training, I joined the company as a Web and Application Developer, contributing to ongoing projects, improving systems, and ensuring the security and stability of live applications.

In addition to development, I focus on networking and cybersecurity. I have completed CCNA 2 and am preparing for CCNA 3. This training has given me a strong understanding of network fundamentals, routing and switching, IP addressing, and network security principles, enabling me to design secure systems and protect digital infrastructures from emerging threats.

I aim to join a professional work environment where I can add real value to the organization by developing secure and innovative software solutions, contributing to advanced technical projects, and maintaining high standards of quality and performance. I am a committed professional, eager to learn continuously, work effectively within a team, and consistently deliver results that align with organizational goals.
